Practical-1: Pen and paper exercises

Georgios Methenitis

November 7, 2016

Exercise 1

We start by the loss function which is given by $\mathcal{L} = 0.5(y_{out} - y_{gt})^2$. Using this we compute the derivatives of the loss function with respect to the weights starting from

$$\begin{aligned}
\frac{\partial \mathcal{L}}{\partial W_{out}} =& \frac{\partial}{\partial W_{out}} \left(0.5(y_{out} - y_{gt})^2\right) \\
=& 2 \times 0.5(y_{out} - y_{gt}) \frac{\partial}{\partial W_{out}}(y_{out} - y_{gt}) \\
=& (y_{out} - y_{gt}) \frac{\partial}{\partial W_{out}} y_{out} \\
=& (y_{out} - y_{gt}) \frac{\partial}{\partial W_{out}} (f_3(W_{out} f_2(w_2 f_1(w_1 x_{in})))) \, , \text{by the chain rule} \\
=& (y_{out} - y_{gt}) \frac{\partial f_3(s_{out})}{\partial W_{out}} z_2.
\end{aligned}$$

Similarly,

$$\begin{aligned}
\frac{\partial \mathcal{L}}{\partial W_2} =& (y_{out} - y_{gt}) \frac{\partial \mathcal{L}}{\partial W_2} (f_3(W_{out} f_2(w_2 f_1(w_1 x_{in})))) \, , \text{by the chain rule} \\
=& (y_{out} - y_{gt}) \frac{\partial f_3(s_{out})}{\partial W_{out}} \frac{\partial \mathcal{L}}{\partial W_2} (f_2(w_2 f_1(w_1 x_{in}))) \\
=& (y_{out} - y_{gt}) \frac{\partial f_3(s_{out})}{\partial W_{out}} \frac{\partial f_2(s_2)}{\partial W_2} z_1.
\end{aligned}$$

And similarly,

$$\begin{aligned}
\frac{\partial \mathcal{L}}{\partial W_1} =& (y_{out} - y_{gt}) \frac{\partial \mathcal{L}}{\partial W_1} (f_3(W_{out} f_2(w_2 f_1(w_1 x_{in}))) \, , \text{by the chain rule} \\
=& (y_{out} - y_{gt}) \frac{\partial f_3(s_{out})}{\partial W_{out}} \frac{\partial f_2(s_2)}{\partial W_2} \frac{\partial \mathcal{L}}{\partial W_1} (f_1(w_1 x_{in}))) \\
=& (y_{out} - y_{gt}) \frac{\partial f_3(s_{out})}{\partial W_{out}} \frac{\partial f_2(s_2)}{\partial W_2} \frac{\partial f_1(s)}{\partial W_1}.
\end{aligned}$$

Prelude

We start by $\Delta W_N = \dfrac{\partial \mathcal{L}}{\partial W_N}$,

$$\Delta W_N = \frac{\partial \mathcal{L}}{\partial W_N} = \delta_N$$

$$\Delta W_{N-1} = \delta_N w_{N-1} \frac{\partial \mathcal{L}}{\partial W_{N-1}}$$

$$\Delta W_{N-2} = \delta_{N-1} w_{N-2} \frac{\partial \mathcal{L}}{\partial W_{N-2}}$$

$$\vdots$$

$$\Delta W_0 = \delta_1 w_0 \frac{\partial \mathcal{L}}{\partial W_0}$$

We can write the general form for the weight updates $\Delta W_{i \to j} = \delta_j z_i$.

Exercise-2

Iteration #1 for the first sample $[0.75, 0.8]$:

- $s_i = [0.458, 0.869, 0.704]$

- $z_i = [0.458, 0.869, 0.704]$

- $s_{out} = 0.098589999999999997$

- $z_{out} = 0.098589999999999997$, using ReLU as activation function in the output unit.

- $\mathcal{L} = 0.40626999405000003$

- $\delta_{out} = (z_{out} - x[0]) \dfrac{\partial \mathcal{L}}{\partial s_{out}} = -0.098589999999999997$

- $\delta_i = \delta_{out} \dfrac{\partial \mathcal{L}}{\partial s_i} = [-0.90141, -0.90141, -0.90141]$

- $w = [0.10256916, 0.18666506, 0.21691853]$

- $W = [[0.7352115, 0.8352115, 0.1352115], [0.1542256, 0.5742256, 1.0242256]]$

Using the following script in python we proceed:

```
_x = x[0] # sample
_y = y[0] # target
s_i = np.dot(_x, W) # forward propagation
z_i = relu(s_i) # relu at s_i
s_out = np.dot(z_i, w) # forward propagation
```

```
z_out = relu(s_out) # relu at s_out
L = error(z_out, _y) # error
delta_out = (z_out - _y) * d_relu(s_out) # error signal at s_out
delta_i = delta_out * d_relu(s_i) # error signal at s_i
Delta_w = - theta * delta_out * z_i # derivative at weights w
Delta_W = - theta * delta_i * _x.reshape((2,1)) # derivative at weights W
w = w + Delta_w # new w
W = W + Delta_W # new W
```

Here we present the results for all iterations and all samples:

```
-Iteration:  0                                      -Iteration:  1                                      -Iteration:  2

Exercise-3

i)

Since $\max(0, p_j - p_{y_i} + margin)$ is minimized when $p_j - p_{y_i} = -margin$ which results $p_j = p_{y_i} - margin$, the loss function is trying to maximize the difference of the probability output for the class p_{y_i} with regards to every other class j by the value of $margin$. In simple words, $\mathcal{L}_{hinge}$ is trying to maximize the difference between probability outputs of different classes.

ii)

$$\frac{\partial \mathcal{L}_{hinge}}{\partial o_j} = \frac{\partial}{\partial o_j}\left(\max(0, p_j - p_{y_i} + margin)\right)$$

For $p_{y_i} > margin$, $\dfrac{\partial \mathcal{L}_{hinge}}{\partial o_j} = 0$, while for $p_{y_i} = margin$, $p_{y_i} > margin$, $\dfrac{\partial \mathcal{L}_{hinge}}{\partial o_j} = \varnothing$. We assume $p_{y_i} < margin$,

$$
\begin{aligned}
\frac{\partial \mathcal{L}_{hinge}}{\partial o_j} &= \frac{\partial}{\partial o_j}\left(p_j - p_{y_i} + margin)\right) \\
&= \frac{\partial}{\partial o_j} p_j \\
&= \frac{\partial}{\partial o_j}\left(\frac{\exp(o_j)}{\sum_k \exp(o_k)}\right) \\
&= \frac{\partial}{\partial o_j}\left(\frac{\exp(o_j)}{exp(o_j) + \sum_{k \neq j} \exp(o_k)}\right) \\
&= (\exp(o_j))'\left(\exp(o_j) + \sum_{k \neq j} \exp(o_k)\right) - \exp(o_j)\left(\exp(o_j) + \sum_{k \neq j} \exp(o_k)\right)' \\
&= \exp(o_j)\left(\exp(o_j) + \sum_{k \neq j} \exp(o_k)\right) - \exp(2o_j) \\
&= \exp(2o_j) + \exp(o_j)\sum_{k \neq j} \exp(o_k) - \exp(2o_j) \\
&= \exp(o_j)\sum_{k \neq j} \exp(o_k),
\end{aligned}
$$

which is the derivative of the loss function $\mathcal{L}_{hinge}$ with respect to o_j.

Exercise-4
